## Outline

- CDFI Background/Overview
- Cable System Failure Process
- SAGE Concept
- Case Study: Roswell
- Diagnostic Accuracies
- Diagnostic Testing Technologies
- Accuracies Really Matter
- The Things We Know Now That We Did Not Know Before
- Selecting a Diagnostic Testing Technology
- Summary

## CDFI Background

Rick Hartlein

## Why do we need diagnostics?

- Underground cable system infrastructure is aging (and failing). Much of the system is older than its design life.
- Not enough money / manufacturing capacity to simply replace cable systems because they are old.
- Need diagnostic tools that can help us decide which cables/accessories to replace & which can be left in service.
- Always remember that we are talking about the cable SYSTEM, not just cable.

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

CDFI Background/Overview

7

## Overview

- In the CDFI, NEETRAC worked with **17 utilities, 5 manufacturers and 5 diagnostic providers** to achieve the objective of **clarifying the concerns and defining the benefits of diagnostic testing.**
- Phase 1 has almost exclusively focused on aged medium voltage systems.
- This is the largest coherent study of cable system diagnostics anywhere.

| HDW Electronics                     | Southern Company                      |
| HV Diagnostics                      | Southwire                             |

## CDFI - Primary Activities

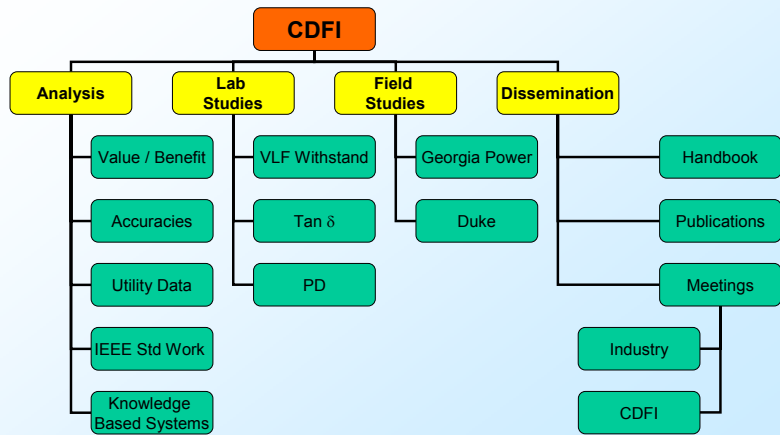

- 1) Technology Review
- 2) Analysis of Existing (Historical) Data
- 3) Collection and Analysis of Field (New) Data
- 4) Verification of VLF Test Levels
- 5) Defect Characterization
- 6) Develop Knowledge Based System
- 7) Quantify Economic Benefits
- 8) Reports, Update Meetings and Tech Transfer Seminars

Analyses are data / results driven

## Benefits from Diagnostic Programs

Decreasing failures associated with diagnostics and actions

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009 **CDFI Background/Overview** 20

## At the Start

- For many utilities, the usefulness of diagnostic testing was unclear.
- The focus was on the technique, not the approach.
- The economic benefits were not well defined.
- There was almost no independently collated and analyzed data.
- There were no independent tools for evaluating diagnostic effectiveness.

## Where we are today (1)

1. Diagnostics work – they tell you many useful things, but not everything.
2. Diagnostics do not work in all situations.
3. Diagnostics have great difficulty definitively determining the longevity of individual devices.
4. Utilities HAVE to act on ALL replacement/repair recommendations to get improved reliability.
5. The performance of a diagnostic program depends on
  - Where you use the diagnostic
  - When you use the diagnostic
  - What diagnostic you use
  - What you do afterwards

## Where we are today (2)

6. Quantitative analysis is complex BUT is needed to clearly see benefits.
7. Diagnostic data require skilled interpretation to establish how to act.
8. No one diagnostic is likely to provide the detailed data required for accurate diagnoses.
9. Large quantities of field data are needed to establish the accuracy/limitations of different diagnostic technologies.
10. *Important to have correct expectations – diagnostics are useful but not perfect!*

## Overview

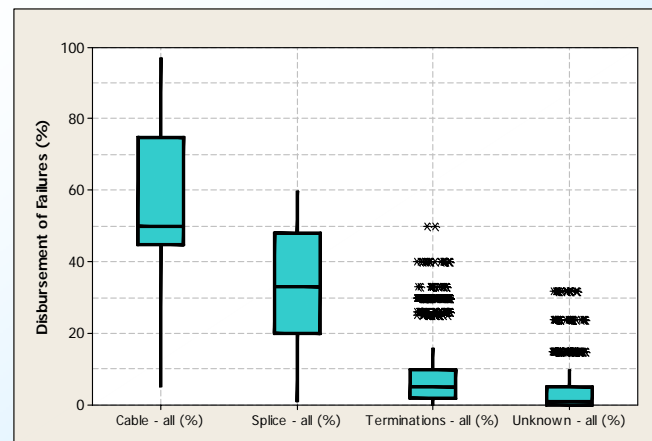

- **In the CDFI, NEETRAC worked with 17 utilities, 5 manufacturers and 5 diagnostic providers to achieve the objective of clarifying the concerns and defining the benefits of diagnostic testing.**
- **We have come a long way wrt the project objective.**
  - Analysis driven by data / results
  - Developed a good understanding that diagnostic testing can be useful, but the technologies are not perfect.
  - Developed ways to define diagnostic technology accuracy and found ways to handle inaccuracies.
  - Developed diagnostic *technology selection* and *economic analysis* tools.
  - Understand that there is yet more to learn.

How things fail and what fails have a big impact on the selection of diagnostics

### Cable System Failure Process

Rick Hartlein

### Failures by Equipment

### Major Cable Components

### Defect Types in Extruded Cables

1. Cavity at shield(s)
2. Cavities due to shrinkage
3. Insulation shield defect
4. Contaminant (poor adhesion)
5. Protrusions at shield(s)
- 6,7 Splinter/Fiber
8. Contaminants in insulation or shields

## Conversion of Water to Electrical Trees

Electrical tree growing from water tree

- Acts as a stress enhancement or protrusion (non-conducting)
- Water tree increases local electric field
- Water tree also creates local mechanical stresses
- **If** electrical and mechanical stresses high enough  $\Rightarrow$  electrical tree initiates
- Electrical tree completes the failure path – rapid growth

## Defect Types in Extruded Cable Accessories

## Diagnostics used in Challenging Areas

## Summary

- Cable system aging is a complex phenomenon.
- Multiple factors cause systems to age.
- Increases in dielectric loss and partial discharge are key phenomenon.
- The aging process is nonlinear.
- Diagnostics must take these factors into consideration.

# SAGE Approach to Diagnostic Programs

Nigel Hampton

## Diagnostic Program Phases - SAGE

### Selection

Data compilation and analysis needed to identify circuits that are at-risk for failure (at-risk population).

### Action

Determine what actions can be taken on circuits based on the results of diagnostic testing.

### Generation

Conduct diagnostic testing of the at-risk population.

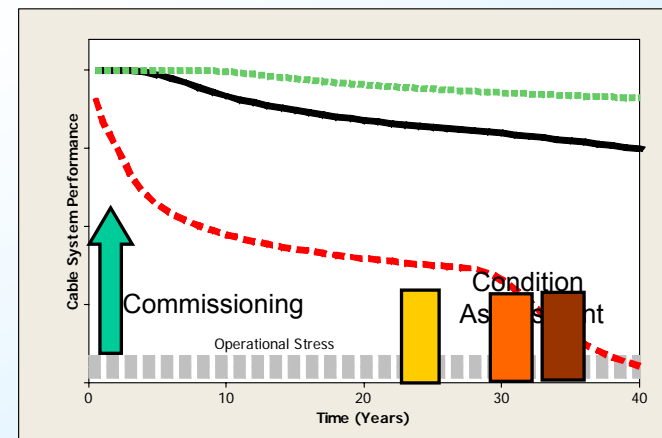

### Evaluation

Monitor at-risk population after testing to observe/improve performance of diagnostic program.

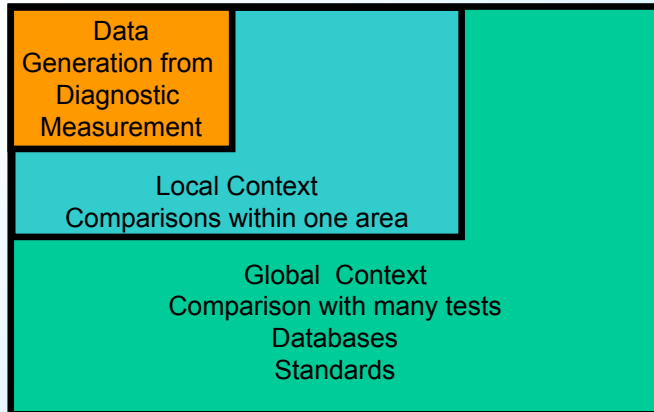

## SAGE at Work

## When to deploy diagnostics

## Context – is important

SELECTION

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

Case Study: Roswell

40

## Roswell Background Info.

- 1980 vintage XLPE feeder cable, 1000 kcmil, 260 mils wall, jacketed.
- Failures have occurred over the years – no data on source
- Recently experienced very high failure rates of splices on this section: 80 failures / 100 miles / yr.
- Overall there have been 10 -15 failures of these splices in last two years on a variety of GPC feeders.
- Splice replacement **may** be acceptable if there is a technical basis.

## Knowledge Based Selection System

## Summary for Diagnostic Selection

| Action Scenario       | Diagnostic Technique |             |             |             |               |                     |           |           |            |                               |
|-----------------------|----------------------|-------------|-------------|-------------|---------------|---------------------|-----------|-----------|------------|-------------------------------|
|                       | DC Withstand         | VLF 15 Mins | VLF 30 Mins | VLF 60 Mins | HV DC Leakage | Monitored Withstand | Tan Delta | PD Online | PD Offline | TDR & Historical Records ONLY |
| Replace Small Portion | Red                  | Green       | Green       | Green       | Red           | Green               | Green     | Green     | Green      | Green                         |
| Replace Segment       | Red                  | Green       | Green       | Green       | Red           | Green               | Green     | Green     | Green      | Green                         |
| Replace Accessories   | Red                  | Green       | Green       | Green       | Red           | Green               | Green     | Green     | Green      | Green                         |

Have a shortlist of three techniques

## Economic Details – prior to testing

- Complete System Replacement \$1,000,000 approx
- Complete Splice Replacement \$60,000
- Test time (determined by switching) 3 - 4 Days
- Selection Costs \$5,000
- Splice Replacement 7 Days
- Retest after remediation 1 Day

**Monitored Withstand, Offline PD and VLF (30 mins) offer economic benefit over doing nothing.**

## Scenario Assessment before Testing

### Offline PD

- If 51,000ft is tested
- 0.5% fails on test, no customer interrupted
- 1 site / 1,000ft (median)
- 40% discharges in cable
- Estimate
  - 0 fails on test
  - 51 discharge sites
    - 20 cable,
    - 31 accessories
  - 15 splices
  - <2 failure in 12 months from test

### Monitored Withstand

- If 51,000ft is tested
- <4% fails on test, no customer interrupted
- 70% of loss tests indicate no further action
- Estimate
  - <2 fails on test
  - 3 assessed for further consideration by loss
  - 0.5 failure in 12 months from test

## Initial Corrective Action Options

- Replace splices only – no detailed records assume 12 splices.
- Complete system replacement.

## Evaluation after Testing

### Offline PD

- 15,000ft actually tested
- Estimate
  - 15 discharge sites
    - 6 cable,
    - 9 accessories
  - 6 splices
  - <1 failure in 12 months from test
- Actual
  - 7 discharge sites
    - 0 cable,
    - 7 accessories
  - 25 splices
  - 0 failure 4 months from test

### Monitored Withstand

- 51,000ft actually tested
- Estimate
  - 2 fails on test
  - 3 assessed for further consideration by loss
  - 0.5 failure in 12 months from test
- Actual
  - 0 fails on test
  - 6 assessed for further consideration by stability, tip up & loss
  - 1 failure (cable) 5 months from test

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

59

## After Testing...

- Actions have been performed by GPC.
  - Suspect splice investigated, actually broken neutral.
  - Damaged termination replaced.
  - Test excavations & Ground Penetrating Radar tests conducted, concluded that it was not practical to replace splices as planned
- System Re enforcements Planned.
- All tested circuits have been left in service and are being monitored by GPC.

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

Case Study: Roswell

60

## Diagnostic Accuracies

Nigel Hampton

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

61

## Performance of Diagnostics

- Performance evaluation primarily focuses on diagnostic accuracy.
- Diagnostic accuracies quantify the diagnostic's ability to correctly assess a circuit's condition.
- Accuracy must be assessed based on "pilot" type field test programs in which no actions are performed.
- Circuits must be tracked for a sufficient period of time.

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

Diagnostic Accuracies 62

## Objective of Diagnostic Tests

The target population contains both "Good" and "Bad" components

- "Good" – Will not fail within diagnostic time horizon
- "Bad" – Will fail within diagnostic time horizon

**"Bad" Components**      **Target Population**      **"Good" Components**

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

Diagnostic Accuracies 63

## Diagnostic Operation

Applying the diagnostic will separate the population into:

- No Action Required group
- Action Required group

But the diagnostic is imperfect...

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

Diagnostic Accuracies 64

## Perspective

- Diagnostics make measurements in the field and find Anomalies.
- Detecting the presence of an Anomaly is, in our view, not sufficient.
- The goal, in our view, is to detect an Anomaly which leads to reduced reliability (failure in service) or compromised performance (severed neutrals – stray voltage).

**In accuracy estimates we have used failures in service and interpreted the diagnostics as “Bad Means Failure.”**

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

## Diagnostic Testing Technologies

Nigel Hampton

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

68

## Introduction

- A wide range of diagnostic techniques are commercially available.
- Tests are performed either offline (circuit de-energized) or online (energized) and by service providers or utility crews.
- Different voltage sources may be used to perform the same measurement.
  - DC
  - 60 Hz. AC
  - Very Low Frequency (VLF) AC
  - Damped AC (DAC)

## Utility Use of Diagnostics

## Diagnostic Survey

- A survey of CDFI participants in 2006 was conducted to determine how diagnostics were employed.
- Survey was updated at the end of 2008.
- Survey results focused CDFI work on technologies currently used in the USA.

## Survey of Use of Diagnostics

## Survey of Use of Diagnostics

## Lengths Tested

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009 **Diagnostic Testing Technologies** 74

## Context

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009 **SAGE Concept** 75

## Diagnostic Context

- Extreme conditions are easy to decide what to do about.
- What to do about the ones in the middle?
- How to define the boundaries?

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009 **Diagnostic Testing Technologies** 76

## Simple Dielectric Withstand

### Test Description

- Application of voltage above normal operating voltage for a prescribed duration.
- Attempts to drive weakest location(s) within cable segment to failure while segment is not in service.

### Field Application

- Offline test that may use:
  - DC
  - 60 Hz. AC
  - VLF AC
  - Damped AC
- Testing may be performed by a service provider or utility crew.

## Dielectric Loss (Tan $\delta$ )

### Test Description

- Measures total cable system loss (cable, elbows, splices & terminations).
- May be performed at one or more frequencies (dielectric spectroscopy).
- May be performed at multiple voltage levels.
- Monitoring may be conducted for long durations.

### Field Application

- Offline test that may use:
  - 60 Hz. AC
  - VLF AC
  - Damped AC
- Testing may be performed by a service provider or utility crew.

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009 **Diagnostic Testing Technologies** 88

## Dielectric Loss (Tan δ)

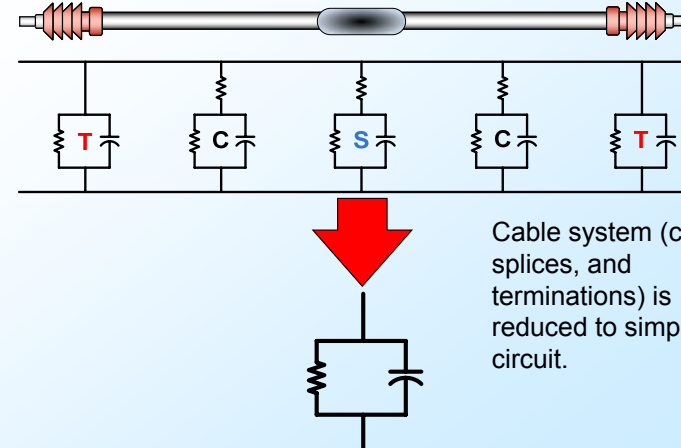

### Dielectric losses - Tan δ:

- The cable insulation system is represented by an equivalent circuit
- In its simplest form it consists of two parameters; a resistor and a capacitor [IEEE Std. 400]
- When voltage is applied to the cable, the total current will be the contributions of the capacitor current and the resistor current

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009 **Diagnostic Testing Technologies** 89

## Testing at Reduced Voltages

## Tan $\delta$ Interpretation

## Time Domain Reflectometry (TDR)

### Test Description

- Measures changes in the cable impedance as a function of circuit length by observing the pattern of wave reflections.
- Used to identify locations of accessories, faults, etc.

### Field Application

- Offline test that uses a low voltage, high frequency pulse generator.
- Testing may be performed by a service provider or utility crew.

## TDR Principles

101

## Online Partial Discharge

### Test Description

- Measurement and interpretation of discharge and signals on cable segments and/or accessories.
- Signals captured over minutes / hours.
- Monitoring may be conducted for long durations.

### Field Application

- Online test that does not require external voltage supply.
- Testing typically only be performed by a service provider.
- Assessment criteria are unique to each embodiment of the technology

## Isothermal Relaxation Current

### Test Description

- Measures the time constant of trapped charges within the insulation material as they are discharged.
- Discharge current is observed for 15-30 minutes.

### Field Application

- Offline test that uses DC to charge the cable segment up to 1kV.
- Testing is performed by a service provider.

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009 **Diagnostic Testing Technologies**

123

## Recovery Voltage

### Test Description

- Similar to IRC only voltage is monitored instead of current

### Field Application

- Offline test that requires initial charging by DC source up to 2kV.
- Testing is performed by a service provider.

Accuracies Really Matter 136

## Benefit and Loss

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

Accuracies Really Matter 137

## Considerations

- Diagnostic program economic calculations are based on ability to **predict** future failures.
- Total diagnostic program cost is more sensitive to certain elements than others.
  - Failure Rate
  - Diagnostic Accuracy
  - Failure Consequence

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

Accuracies Really Matter 138

## Diagnostic Accuracy Complications

- Time is a critical factor in the assessment of accuracy.
  - Failures do not happen immediately after testing.
- Two approaches to computing diagnostic accuracy.
  - “Bad Means Failure” Approach
  - “Probabilistic” Approach

# CDFI Dielectric Withstand

Josh Perkel

## Dielectric Withstand

- Withstand techniques are most widely used diagnostic in the USA.
- Most utilities use VLF (either sine or cosine-rectangular) in their withstand programs.
- Test duration and voltage are critical to performance on test and in service.
- Explored the concept of “Monitored” Withstand tests.

## Length Distribution (Overall)

## Length Effects

- Comparison of withstand failure on test rates must include length adjustments.

CDFI Research

151

## Overview

- Test program combining aging at  $U_0$  with multiple applications of high voltage VLF.
- Uses field aged cable samples - one area within one utility.
- Evaluate the effects of
  - Voltage and time on the performance on test and
  - Subsequent reliability during service voltages.

### Primary Metric

Survival during aging and testing

### Secondary Metrics

- Before and after each VLF application, PD at  $U_0$
- Between Phase A & B IRC, PD (AC  $2.2U_0$ , DAC),  $\tan \delta$

157

## VLF Test Program Summary

- Analysis of Phase A is complete.
- Phase B ( $2U_0$  aging,  $45^\circ\text{C}$  Cosine Rectangular) underway.
- Phases A & B show that **no VLF exposed samples have failed under 60 Hz aging @  $U_0$  &  $2U_0$ .**
- Phase B tests showed **two samples without VLF exposure failed during 60 Hz aging @  $2U_0$ .**
- All failures occurred at the appropriate time. i.e. within the VLF testing periods.
- 80% (4 out of 5) of VLF failures between 15 and 60 mins

## Selecting a Diagnostic Technology Knowledge-Based System

Nigel Hampton

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

Selecting a Diagnostic Technology

159

## KBS

- Selecting the right diagnostic is not easy.
- No one diagnostic covers everything.
- How you measure is influenced by what you do with the results.
- The KBS captures the experience and knowledge of people who have been operating in the field

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

Selecting a Diagnostic Technology

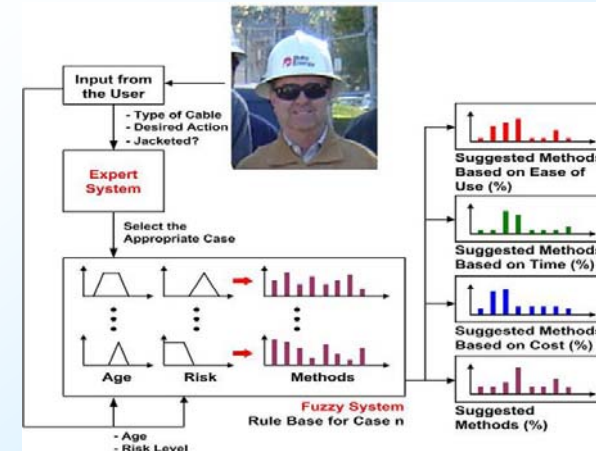

160

## Knowledge Based Systems

- Knowledge-Based Systems are computer systems that are programmed to imitate human problem-solving.
- Uses a combination of artificial intelligence and reference to a database of knowledge on a particular subject.
- KBS are generally classified into:
  - Expert Systems
  - Case Based Reasoning
  - Fuzzy Logic Based Systems
  - Neural Networks

## Short Listing of Diagnostic Approaches

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009 **Selecting a Diagnostic Technology** 164

## Impact of Remedial Action

- Hybrid Cable System
- Most service failures occur in Accessories
- Usual remediation is by replacement of cable sections

| System Component | Portion [%] | Service Failure Rate | Age [yrs] |
|------------------|-------------|----------------------|-----------|
| PE               | 33          | Medium               | 20 - 30   |
| EPR              | 42          | Low                  | 0 - 10    |
| Paper            | 25          | High                 | 40 - 50   |

## Hybrid Cable System

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009 **Selecting a Diagnostic Technology** 166

## Summary

Rick Hartlein

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

167

## What we have learned about diagnostics (1)

1. A developing database of field failure diagnostic data shows that different diagnostic techniques can provide some indication about cable system condition.
2. Even if the diagnostics themselves are imprecise, diagnostic programs can be beneficial.
3. Benefits can be quantified, however this is not simple and requires effort.
4. Many different data analysis techniques, including some non conventional approaches, are needed to assess diagnostic effectiveness.
5. Utilities HAVE to act on ALL replacement/repair recommendations to get improved reliability.

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

**Summary** 168

## What we have learned about diagnostics (2)

6. PD, VLF, DC and Tan  $\delta$  & VLF withstand tests detect problems in the field and can be used to improve system reliability.
7. It is very difficult to predict whether or not the problems/defects detected by PD and Tan  $\delta$  will lead to failure in the short/medium term.
8. PD assessments are good at establishing groups of cable system segments that are not likely to fail.
9. Tan  $\delta$  measurements provide a number of interesting features for assessing the condition of cable systems.
10. Tan  $\delta$  & PD measurements require interpretation to establish how to act.

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

Summary 169

## What we have learned about diagnostics (3)

11. Interpretation of PD measurements is more complex than interpretation of Tan  $\delta$  measurements.
12. IRC & RV are particularly difficult to deploy in the field.

Presented at the Spring 2009 ICC Education Session Copyright GTRC 2009

Summary 170

## Reflections

- Approach to data analysis established in CDFI
- Many questions answered, there still remain gaps in our understanding of:
  - Benefits
  - Distinguishing anomalies from weaknesses
- Answers will come with continued analysis of field test data (diagnostic tests followed by circuit performance monitoring) as well as controlled laboratory tests.
- The potential value of continued analysis is high.
